

## REMOTE RADIO RECEIVER

## ABSTRACT

A remote radio receiver includes audio circuitry, a user selection interface, user control circuitry and input/output interface. The audio circuitry is for receiving a digital audio stream and playing extracted audio signals over a speaker. The user control circuitry generates control signals as a result of a user interacting with the user selection interface. The input/output interface provides connection to a remote computer. The input/output interface forwards the digital audio stream from the remote computer to the audio circuitry. The input/output interface forwards the control signals from the user control circuitry to the remote computer.
